

High Frequency Repellers

These units target pest birds with unrelenting high frequency sound waves often above the range of human hearing which force the birds to leave for good, yet are harmless to them and the environment.

APPLICATIONS

Ideal for enclosed and semi-enclosed areas, such as warehouses, loading docks and gas stations where a sonic unit may interfere with humans using the area.

Sonic Repellers

These units produce audible sounds, usually distress and predator calls which make pest animals perceive danger. Once agitated and disoriented they flee - and won't return.

APPLICATIONS

Ideal for large open areas such as rooftops, parking lots, ponds and parks, golf courses, where visual scare devices would not provide a sufficient deterrent effect.

Our products are supplied by **BIRD-X**, the established leader in pest bird control for over 40 years:

Bird Control "X-Perts" since 1964

Visual Scare Devices

These devices use various visual effects, including images of predators and reflections and flashes of light which bother and disorient birds. Products which incorporate movement can be effective yet economical and provide a long-term solution.

APPLICATIONS

Ideal for home users and small areas where an economical solution is desired. Very effective when used in conjunction with any other bird control tactics.

Roost Inhibitors

These solutions prevent birds from accessing roosting areas on your building, making roosting and nesting sites uncomfortable or impossible - physical barriers are hard for birds to bypass.

APPLICATIONS

Ideal for highly desirable roosting locations which are small in area, e.g. ledges / windowsills, and often difficult to target with other solutions.

No matter how bad your pigeon problem is we have the products and the expertise to help you 'clean up' your neighbourhood.
